Best rechargeable batteries aa uk

Cronillo/Shutterstock Disposable alkaline batteries feel like a ripoff. They are expensive, they have less capacity, and they can leak while in storage. So why not power your new keyboard, gamepad, camera, and musical instruments with a set of rechargeable AA or AAA batteries? In rechargeable batteries to see what's weird as it sounds, rechargeable batteries can vary widely in price. But what's the difference between \$10 and \$20 set of rechargeable batteries? All this has to do with capacity, recharge cycles, self-discharge, and continuity. Capacity: Rechargeable AA and AAA batteries are now per-charge compared to disposable batteries. Most rechargeable ASS has a capacity of 2,000 mAh, while most AAAS has a capacity of 800 mAh. If you want a battery that works well with power-hungry electronics, get one with an above-average capacity. (Clearly, the average raw capacity of alkaline ass is 2,500- more than rechargeables.) But alkaline batteries migrate faster than rechargeables, so their high raw capacity doesn't mean much. It's like comparing the old and inefficient filament lightbulb with the new LED. Cycle: Rechargeable batteries break down gradually each time used. In most cases, the time it takes to break the battery is rated in terms of recharge cycle (how often the battery is drained and recharged). If you burn through the battery, then look for a set that is rated for nearly 500 cycles. Self-discharge: Rechargeable batteries gradually lose their charge while not in use. If you want a set of rechargeable for low-power electronics or something that's going to sit in storage, you'd buy a brand that's known for a low self-discharge rate. Continuity: Cheap rechargeable batteries suffer from incompatible capabilities and age. For most applications, this is not a huge deal. But if you're trying to get the best performance from your battery, it's best to match them all. Now when you know what you're looking for in rechargeable batteries get it. Here are our favourite rechargeable AA and AAA batteries. Best Rechargeable AA: Panasonic Enloop Pro Rechargeable AA Battery (4-Pack) has a high 2,560 mAh battery, they can endure 500 recharge cycles, and they are made with premium, consistent quality that you won't find in other brands. They also have a low self-discharge rate, meaning that their charges are known to be holding for a long time in low-power electronics (or around a year in storage). These are the best rechargeable ass for most people's needs. Just know that the cost of Enloop professionals is very high- almost twice as much as AmazonBasix or Energizer rechargeable batteries. If this is your first set of rechargeables, you can save a little from buying the Enloop Pro starter set. It comes with four Enloop Pro AAS and a Panasonic A/A/AAA battery charger. Best Budget Rechargeable AA: AmazonBasics (4-Pack) AmazonBasics You're looking for a Set of rechargeable ass, then AmazonBasics is your best bet. These rechargeables have (surprisingly large) 2,400 mAh capacity, but Amazon doesn't specify how many charge cycles they can endure – a sign that they're not built with too much stability. In our experience, AmazonBasics rechargeable AA batteries are quite reliable. But some of the batteries lose their charge or fail faster than others. They're worth putting in an Xbox controller, a wireless keyboard, or a set of motion-sensing lights, but don't be surprised if they act a little weird. Highest Capacity Rechargeable AA: EBL (8-Pack) EBL EBL is a small electronics brand that focuses on tackling the rechargeable battery market. And as of right now, the company is doing a great job. Its rechargeable AA battery (8-pack) has a massive 2,800 mAh capacity, and EBL claims they can endure 1,200 recharge cycles. But unlike Enloop pros, these EBL batteries have a fairly fast self-discharge rate, meaning they will drain faster than Enloop pros when used in low resource electronics (like TV remote and simple wireless keyboard). We suggest using these batteries in power-hungry electronics, such as cameras, lights, and musical instruments. In this way, you will make the most of their ability without getting a little off your self-discharge rate. Best Rechargeable AAA: Panasonic Enloop Pro (4-pack) Panasonic Panasonic's Enelope Pro rechargeable AAA battery (4-pack) has a large 950 mAh capacity, and they can endure 500 recharge cycles before they fail. Like Enelope AA batteries, these AAA batteries are known for their consistent build quality and low self-discharge rate (they must keep a charge while in storage for a year). Of course, they are also known for their high price tags. They're worth the money if you need a reliable set of high-capacity AAAs, but there are cheaper options that might get the job done. Panasonic also sells these batteries with a charger, if you're looking for a cheap starter set) Best Budget Rechargeable AAA: Energizer (4-pack) Energizer Energizer's Rechargeable AAA Battery (4-Pack) are stolen. They have a modest 800 mAh capacity- Energizer claims they live for 700 recharge cycles (when recharged at moderate capacity) - and they have a low self-discharge rate (they should keep charging after a year in storage). They are also made with a slightly higher consistency than similarly priced rechargeable AAAs. Highest Capacity Rechargeable AAA: EBL (8-Pack) EBL If you're trying to get the most of your high power electronics, you should catch some rechargeable AAA batteries of EBL. They have a capacity of 1,100 mAh, and EBL claims they can endure 1,200 recharge cycles. Just keep in mind that these EBL batteries have a higher self discharge rate. They'll lose their charges after a few months in storage, or even a few months in a low-power electronic (like a TV remote). We suggest using them for electronics that can walk through a set in the same week or month, like cameras, musical instruments, and retro game consoles. In this way, you will make the most of their high capacity without getting a little from their discharge rate. Don't forget the charger: EBL 8-Bay AA and AAA Charger EBL Don't forget to buy the charger for all your new batteries. The EBL 8-Bay AA and AAA charger is one of the cheapest options on the market, and has enough slots to charge 8 AA or AAA batteries at once (each slot has connectors for AA or AAA size batteries). Of course, you can always buy a rechargeable battery and charger set from a company like Panasonic or Energizer. The above article may have affiliate links, which help support review geek. More show more > Update November 24, 2020Rechargeable batteries have many advantages over disposable options. For an initial elevated investment, they provide hours of electricity through multiple recharge cycles. With the extra low self-discharge battery fully charging and ready to go, you'll never be caught without the right battery for your TV remote, clock or game controller ever again. If you want to invest in a new, set of rechargeable batteries for your first, or your home appliances, there are a variety of different brands to choose from. While the decision on rechargeable batteries isn't as complicated as buying a new laptop, phone or smart watch, there are still important features to ensure that you get the best value product for your needs. We took a look at the best rechargeable batteries on the market right now and chose our top picks for AA batteries. These Amazon Basics installed high-capacity rechargeable batteries and stand out against competition from well-known brands. They have a long battery life and, unlike some other high-capacity batteries, they are suitable for high and low-drain devices. They also come handy pre-charging for convenience and can be used with no waiting around straight out of the packet. They can be fully recharged back to 100% capacity (even after three years of use) and recharged hundreds of times to ensure that you get the price of your money. Being a high-capacity variety, they maintain longer charge than traditional AA rechargeable batteries. They also have low self-discharge, which means you can pre-charge your spares without fear of them before use. This means that there will be minimal capacity or loss of power. These batteries are more expensive than Amazon's basic AA rechargeable batteries, but we felt the extra capacity gained was worth the small increase in price. Note that, for comparison purposes, Amazon Basic AA rechargeable batteries are only available in a pack of 12, which makes them £1.57 per battery next to Amazon Basics high capacity rechargeable priced at £1.81 per battery. The quality of these batteries is confirmed by Amazon reviewers who rate the battery 4/12 stars. A remarkable review praises low discharge rates, citing that the battery is coming with 'The stamp for the last 6 months came with a charge of about 90-95%. Batteries are advertised to maintain 70% capacity for 6 months and 50% capacity after 12 months. They are recycled and must be recycled at their local recycling station at the end of their useful life. We found that the only Amazon Basics battery available for Amazon Prime delivery is 16 packs of Amazon Basics high capacity rechargeable batteries. If you're signing up on Amazon Prime and are accustomed to or need quick delivery, it might be best to increase the pack size. With a superb 2,300 mAh capacity, the Energizer Recharge Extreme AA battery is long lasting with a single charge, has low self-discharge and can be recharged up to 500 times. They are a reliable choice and offer a good balance between capacity rating and cost. They are significantly cheaper than their fellow Enelope Pro high-capacity cousins and are currently cheaper on Amazon than Panasonic Enelope AAS with 1,900 mAh capacity. However, with the Enelope Pro range it is noteworthy that the increase in battery capacity leads to a slightly shorter shelf life for the battery, but you will see an enhanced performance during this time. These energizers are pre-charged so they can be used directly from the packet. They will take charge in storage for one year. The Recharge Extreme range is also made with 4% recycled batteries, signaling that Energizer is making efforts to deal with environmental concerns. Energizer is a well-known, trusted brand and produces a good quality product. These EBL rechargeable batteries can be charged approximately 1,200 times and have no memory effect so recharging can be done from full or partial charge. They are said to reach full performance after three to five full fee/usage cycles. They have a capacity of 1100 mAh, the highest of the AAA batteries we have reviewed, and maintain 80% of their capacity after three years of storage/non-use. Unlike other batteries reviewed in this article, however, EBL batteries do not come with full pre-charge. They should be charged before use as they are only 20% charged on arrival. It is cited by the manufacturer as being for shipping safety purposes. Given the speed of charging, this is only a minor inconvenience and has only become an issue if you need a battery for immediate use on purchase. Why buy rechargeable batteries Although it may seem that all devices have sealed battery units these days, we still have items around the house that require either AA battery. The examples you may have in your own home are TV remotes, wireless mice, game console controllers, flameless candles, hand-held torches, fairy light wires, pepper or salt grinders and wall clocks. For products that come into use regularly, rechargeable batteries are cost effective over the long term. The price of rechargeable batteries has gone down greatly in recent years, meaning around six in Cycle, they have already paid for themselves and prove themselves to be much cheaper than their counterpart disposable. This is also the case when factoring in the initial cost of the charger. It is convenient to have the ability to recharge the battery in a few hours. Rechargeable batteries mean you don't have any new batteries for your gadget, the days of finding it are over - just take out the existing batteries, charge and replace them. No need for a trip to the high street or an Amazon delivery every time devices go flat. Moreover, the technology of rechargeable batteries has also made a lot of progress since its first days. I have memories of having a forced hiatus, waiting slightly frustrated for charging indicator light to finally hold steady and indicate full charges. Most rechargeable batteries are now made from nickel metal hydride (NiMH), as opposed to nickel cadmium (NiCD). Nickel metal hydride (NiMH) is far better. NiMH batteries can hold charging for long, can be used again several times and can hold higher capabilities. Finally, rechargeable batteries are better for the environment. Low shipping and the creation of disposable means you're helping to protect the planet from any additional battery-induced carbon emissions. With an average life span of four years, rechargeable batteries dramatically reduce the number of batteries to consume a home, cutting both landfill waste, shipping containers and delivery vans. You should always recycle your disposable and rechargeable batteries when they reach the end of their useful life. Are there times when rechargeable batteries should not be used? While rechargeable batteries are undoubtedly the way to go to power the majority of your battery-powered devices, there are still some instances or tools where disposable batteries will be better. Initially, and very importantly, it is not recommended to use rechargeable batteries in your smoke detector. Stick to disposable batteries for this. Another occasion where disposables serve better when hiking, backpacking or camping. If you're set out on a long trail with limited access to power points along the way, it makes sense to pack an extra disposable battery for your torch and other battery-powered objects. Avoid excess weight and hassle of rechargeable batteries and their chargers. Since disposable batteries have a longer life, they are a safe bet for instances – such as jungle search – where you may not have charging facilities or access to replacement batteries or devices. It is sometimes noted that some low power tools actually work better with disposable batteries. This is because charging into a disposable battery suddenly died completely, instead of leaving items, such as a wall clock or battery-powered light, operating under its intended threshold. It can be a problem if you fail to see your watch is slow-moving - although, in today's world, some of us might say we use one clock as our main gauge of time. With a bit of observation and further planning, though, rechargeable batteries can usually work just as well to power up such objects. Another safety note: not all battery types are rechargeable. You should never put a non-rechargeable battery in a rechargeable battery charger. Tips for using rechargeable battery stores in a cool dry place – these are the optimal conditions for storing your battery. Avoid placing them in the refrigerator or freezer according to myth. Do not overcharge - overcharging your battery reduces the battery faster and this may mean that a small amount of power leaks. As a result, the battery will not be fully charged when you come to use them. Some chargers have an inbuilt feature that stops charging after the battery is full, but not all, and it's a good practice not to rely on this feature. To avoid overcharging, it is recommended not to put batteries on charge overnight. Don't mix brands - Due to the difference in power hold, batteries from different brands can charge together, while it is not recommended to put a mix of battery brands into a single device. Recycle – Once again, do your bit to ensure safe disposal by reducing landfills and recycling your old battery. Many supermarkets have battery recycling containers. Key features to watch - What makes a good rechargeable battery? When conducting our review, we looked for and compared the following features: The number of batteries in a pack we saw for batteries that are sold in an eight-pack. This is because it makes sense that you double the number of batteries you need so that you can be optional when charging others. If your device only needs two batteries, however, a four-pack will suffice. What charger is included? Some batteries are also available to buy in combo packs with chargers. Where a good value deal is available, it has been flagged and contains links. Most rechargeable batteries are compatible with all standard NiMH chargers. Chemical composition is important as it affects the performance of the battery. We considered nickel metal hydride (NiMH) batteries only in our review because it is the latest and most effective material. Price/value for money An eight-pack (or equivalent) rechargeable battery can cost between £6.99 and £21.90 (excluding chargers). We noticed the price to ensure that, as a consumer, you are getting the capacity and specifications you expect for the price. Low self-discharge low self-discharge means that the battery will maintain charge in storage/non-use in the long term. An indication of this is quoted in the remaining percentage capacity over a period of six months or 12 months. High capacity rating is recommended in MAH (milliamp hours) batteries with a capacity of 1,900 mAh or more. Time charge is held longer rechargeable batteries hold their charge, less regularly you recharge them to your will be required to keep the tax it depends on the capacity rating above. Pre-charge the most rechargeable batteries are now sold pre-charge which is handy if you are out and want to buy a battery to use immediately. Longevity is the number of charging cycles the battery is predicted to withstand. When investing in rechargeable batteries, you'll want to know if they have a long shelf-life and hundreds can be recharged, if not thousands of times. Performance will inevitably decrease over time, especially as the battery begins to reach the end of its useful life, but the high signal cycle rating was now designed to last the battery. Other rechargeable batteries We reviewed while conducting our research, we reviewed a large number of rechargeable battery brands. In addition to our top picks, below are some other batteries that you might consider buying to meet your battery-powered needs. The battery is conducted by brand instead of type (AA or AAA). Amazon capacity available for £8.89 pack of 4: 850 mAh Like their AA cousins, these AAA batteries come pre-charged, provide a gradual self-discharge and have minimal power and capacity loss. They have a higher capacity figure, which maintains 80% of their capacity for 12 months. They come with a good capacity rating of 850 mAh for AAA batteries. Pack of 12 available for £18.89 from Amazon Capacity: 2.0 mAh Amazon Basics AA rechargeable batteries come pre-charged and can be recharged up to 1.0 times with minimal power loss. Amazon isn't currently selling them in anything smaller than a 12 pack, but given the low price, even as a big pack purchase, these batteries are great value. They have a lower capacity rating than Amazon Basics high capacity range at 2,000 mAh, but are similar to the above battery at all other specification points. These Panasonic Enloop rechargeable batteries are pre-charged by solar energy for immediate use, making them even more attractive to those switching to rechargeable batteries due to practical and environmental concerns. They have low self-discharge so can be fully charged with minimal leakage for electricity. Even after 10 years of storage, they should still maintain 70% capacity. These batteries can be recharged up to an amazing 2,100 times with all standard NiMH chargers. Enloop provides the highest number of recharge cycles of all rechargeable batteries we saw. They are slightly more expensive than the Energizer Recharge Extreme AA battery, but make up for it with this incredibly high number of charge-discharge cycles. However, it's worth noting that it has a slightly lower capacity rating of 1,900 mAh off the trade.' Usefully, the battery has no memory effect, so can be recycled when discharged completely or partially – meaning you don't need to be caught at no charge. They are also low temperature resistant, working in temperatures below -20 degrees Celsius. This means you can feel using batteries on when skiing or climbing trips in extreme climates. The storage case can be chosen as an optional addition with these batteries is incredibly handy, keeping them neatly together rather than rolling around loosely in your kitchen or office drawer. Available for £16.90 with a storage box pack of 8, from Amazon Capacity: The 750 mAh standard Panasonic Enloop range also includes AAA battery. Because these are AAA instead of AA batteries, they have a low capacity rating of 750 mAh. This is not the highest capacity provided by AAA batteries, but it is a decent capability for A. We love the fact that all Panasonic Enloop batteries are pre-charged with solar energy. They can be employed in immediate access to their facility, whilst being more environmentally friendly options. These AAA batteries have the highest recharge rating out of the batteries we review and are rechargeable up to 2,100 times. As with excursions, their extremely low self-discharge means they can be fully charged for increased justification when they are required - they will hold 70% of the capacity even after 10 years of storage. Like their AA cousins, they are also low temperature resistant (below 120 degrees Celsius) and therefore great for any cold weather adventure gear power. They can be flexibly charged with all standard NiMH chargers and are a great choice for the long-term power of all your AAAA devices. Pack of 8 multipacks. Available for £18.99 from Amazon Capacity: 1,900 mAh/750mAh which would like both rechargeable AA and AAAA in-house, Panasonic Enloeps are available in an AA and AAAA multipack option with four of each battery type. The AAS of 1,900 mAh and 750 in the vicinity is an mAh. This versatile pack is great for a range of games, toys and home appliances – having both types of batteries means you can't get caught. With a low self-discharge rate - 70% capacity should be remaining after 10 years - these batteries are a great long-term investment. Panasonic Enloep batteries (capacity: 1,900 mAh/750mAh) are also sold on Amazon in a 4 pack with a USB charger for £25.76. This charger has smart charge which detects voltage and stops battery charging before it overflows to preserve long battery life. To allow for direct comparison, the equivalent price for the 8 battery is £27.90 (without case). Capacity: The 2,500 mAh Panasonic Enloop Pro A. Battery has a very high capacity and with a great area from the same charger, they are perfect for use in high-groove devices with high power requirement. They hold the charge brilliantly in storage so your spares can be charged ready and waiting to go. After one year, the capacity remains at 85%. The high capacity seems to come with a longevity trade-off, though, with the Enelope Pro 500 battery lasting for an average of recharges. However, it is a standard figure between high-capacity rechargeable batteries and a lot of power and length The charge cycle provided by these batteries is excellent. Although they are the most expensive battery reviews, you get exactly what you pay for. Only allow for direct comparison available in a pack of 4 for £13.69 from AmazonTo. The equivalent price for 8 batteries is £27.38 capacity: The 930 mAh Enloop Pro AAA range comes with a capacity of 930 mAh compared to 750mAh of standard Enloop AAA battery, so they are a good choice for high powered devices requiring A batteries as they will need to charge less frequently. Like all others in the Enelope range, these batteries are eco-friendly and pre-charged with solar power. Note The Enelope Pro range appears to be sold in packs of only two or four batteries. Pack of 8 available for £12.49 from Amazon Capacity: The 2.0 mAh Energizer Power Plus is the world's first rechargeable AA battery to use recycled material, as it is built with 4% recycled battery. The battery comes pre-charged and each battery can be charged further 1.0 times. The battery charge will last up to 12 months in storage, meaning the charging battery can be stored for use at its convenience. While a charging provides electric hours depending on the device and the intensity of use, these batteries provide an average of activity when used in a toy and 7.5 hours of activity when used for a hand-in-hand gaming device. Pack of 4, allow for RRP £13 direct comparison from AmazonTo, equivalent price for 8 batteries is £26.00 capacity: 800 mAh These AAAA recharges extreme batteries come pre-charge and ready to use. The battery can be charged 500 times and its charge can be retained in storage and other brands. From AmazonTo 4, RRP allow for pack direct comparison of £14.99, equivalent price for 8 batteries has £29.98 capacity: 2,500 mAhAhaeeli's high-performance rechargeable ultra battery is good value for its high capacity rating of 2500 mAh and come pre-charge for convenience so you can use them directly from the pack. Duracell's Durlock technology prevents batteries from losing power through self-discharge and as a result, the battery maintains its charge well in storage. Unlike most other rechargeable batteries, Duracell's Ultras come with the guarantee that they will last up to five years or 300 recharges (whichever comes first). This may seem like a lower recharge figure than other brands which claim their batteries will last for thousands of charges, but remember that it is backed by a guarantee. Also remember that the high capacity offer of these batteries reduces shelf-life. Comparable battery in terms of Such as Energies recharge extreme AA and Panasonic Enloop Pro AA, the figure of 500 recharges shows, but does not provide guarantees simultaneously. Allow for 4-pack direct comparison from AmazonTo to £7.99, the equivalent price for 8 batteries is £15.98 Capacity: 2,100 mAh These verta batteries are great value and are advertised as having longer usage cycles due to their fairly high capacity rating. They can be recharged for 1.0 uses and toys and home appliances can be used for electricity. They are rechargeable without memory effects, meaning they can be charged back at full charge from any level of capacity without damaging effects on future battery capacity. The battery is supposed to have a good low self discharge rate, with the remaining charge after 12 months of storage up to 75%. Additionally, they are protected against damages that may be caused by higher charges. This is useful because it is very easy to leave the battery in your charger longer than needed. A very high capacity 2,600 mAh option is also available for £11.40 for a pack of 4. £8.87 from AmazonTo allow for 4's pack direct comparison to RRP. Equivalent price for 8 batteries is £17.74 capacity: 1,000 mAh Varta's recharge power high capacity AAA 1,000 mAh batteries are currently available for the same price as the regular recharge power 800 mAh AAAs, so I have chosen to mention the high capacity like their AA Varta cousins , they are rechargeable without memory effects, all compatible with standard NiMH charger and have a good capability to offer. Pack of 8 available for £14.99 RRP from Amazon Capacity: 2,800 mAh EBL's rechargeable ass are particularly high-capacity, with very low self-discharge. They have a good charging retention rate with batteries maintaining 80% capacity after three years of storage. With AAA EBLs, these batteries can be recharged 1,200 times when completely or partially drained. They require full charging before use because they are only pre-charged at 20% capacity, which is quoted for safety reasons during shipping. Pack of 8 (4 of each type) is available from Amazon for £16.99 If you require both AA and AAA batteries or are seeking a charger, the above EBL batteries are also sold complete with a USB charger in a great price AA and AAA multipack. Each type includes four batteries. If you need a charger for your battery, EBL also sells an eight-bay AA and AAA smart battery charger that is available to buy from Amazon for £12.11. Available for £9.59 from AmazonTo allow for pack direct comparison of 4, the equivalent price for 8 batteries is £13.98 capacity: 2,450 mAh In Ikea Ladda A. Batteries can be recharged 1,500 times and come pre-charge so they can be used directly away in their devices. The capacity rating of 2,450 mAh for the price is excellent. Available for £9.22 from AmazonTo allow for 4-pack direct comparison, equivalent price for 8 batteries is £13.98 capacity: 900 Ikea Ladda AAA battery, like AA Laddas, can be charged for up to 1,500 usage cycles and pre-charged for justification is sold. Their capacity rating of 900 mAh is good for AAA batteries. The Ikea delivery charge brings the price of ladda battery to the same and delivery is only available in select locations, but these are a great option if you're already planning a trip to your local Ikea. They are well worth choosing with your flat-pack storage solutions. Or purchase on Amazon for direct delivery. Check out the table below to see quick statistics for AA and AAA batteries we reviewed. Battery Name/BrandTypePack SizePress Capacitase (mAh) No. Recharge (up to) capacity retention (unless stored) Additional FeaturesAmazon Basics A. Storage After 3 years of storage capacity only 20% pre-chargerizer recharge extreme AAA batteries4 £13.00 (equivalent to £26.00 for 8) comes with 8 4% recycled batteriesPansononic Enloop AA and AAA Combination Rechargeable Multipack and AAA8 £18.99 Give your charge in storage for up to 12 months with 10 years later, after 10 years self-discharge solar power EBL AA and AAA rechargeable battery multipack (with charger) AA and AAA8 £16.992.500/1.1001.20080% capacity comes with 20% pre-charge. No memory effects. While initially setting you back more than regular disposable batteries, long-term rechargeable batteries are the best choice in terms of convenience, price and environment. It is important to consider the capacity rating and number of recharges offered for the price, but it is safe to say that a lot of progress has been made in the technology of rechargeable batteries. All batteries above must fit for purpose, however, depending on the intended use for batteries, different criteria will be preferred: Capacity, recharge cycle or overall longevity. We hope this article has helped speed up and mysterious the process of choosing the best rechargeable battery for your needs. Please note that all quoted values were correct at the time of writing. Prices on Amazon may fluctuate, so it is recommended to check current prices for the time of your purchase. To buy.
